

AMENDMENT TO THE ABSTRACT

Please substitute the following for the Abstract:

A cutting device, particularly suited for removing vehicle glazing panels, has forward blade carrier and a rearward handle spaced from the forward blade carrier. The forward blade carrier may function as a handle, the device thereby being operable in two handed use. The rearward handle and forward blade carrier may be movable relative to one another permitting re-configuration of the device. The rearward handle and forward blade carrier may be connected by a bridge portion. Novel aspects of the blade and lubrication for the device are also described and claimed.
